SEMPER PREVIO - flexible gel adhesive 2-15 mm

Flexible gel adhesive mortar intended for fixing ceramic tiles (including large-format ones) such as glazed tiles, stoneware, clinker tiles, natural stone and artificial conglomerate stone on deformable and non-deformable substrates inside and outside buildings. It can also be applied to properly seasoned and prepared anhydrite and gypsum substrates. It is frost-resistant, waterproof and resistant to external factors. It can be used to lay tiles in a floor heating system. Thanks to excellent technical and operational parameters, it is efficient and convenient to use.

Thanks to the use of special ingredients that give a gel consistency,

the adhesive retains water in the system, which increases adhesion to the substrate and is less sensitive to overdosing of mixing water, without causing the tile to slip. The maximum surface of the glued tile: 0.70 m².

TYPE: C2TE
